SULPHATE OF POTASH

SOP is a low chloride granular fertiliser with high levels of both potassium and sulphur. Being water soluble, both nutrients are immediately available to the plant.

Potassium helps the 'blood flow' of the plant, enabling sugars and waters to move around. It thickens cell walls, protects against drought, and helps the plant defend against disease.

The difference between SOP and Muriate of Potash (MOP) is that SOP does not contain chloride and has a lower salt index. In certain crops, soils and water types, SOP could be preferred over MOP.

SOP is especially suitable for use in high value crops and intensive cropping systems and often recommended for use in fruit, vegetable and nut production.
