

Manufactured by Wengfu, SLAM® is a unique, premium granular ammonium sulphate fertiliser, containing Nitrogen, Phosphorus and Sulphur. The Nitrogen contained in SLAM is in the ammonium form, creating a strong bond with organic matter in the soil, stopping volatilisation. The sulphur in SLAM® is sulphate sulphur providing immediate availability to the plants. SLAM® can be used as a stand-alone product or commonly used to create unique blends suitable across a range of pasture and cropping situations. SLAM® is commonly used in Canola, which has a particularly high demand for sulphur.

SLAM® provides flexibility and is used at both sowing with planting fertilisers or at topdressing with urea.

SLAM® can be stored in sheds for extended periods without degradation whilst maintaining good handling properties.
